

Table 1 Countries and Weights of Capitalization

This table reports the information of the countries whose MSCI indices are investigated in the paper. The third column shows the equity market capitalization in millions of U.S. dollars of these countries as of the end of year 2002 obtained from the World Federation of Exchanges. The fourth column presents the weight of each country as a fraction of the total market value of these countries. (Unit: Million in USD, %)

Panel A: Developed Countries

Country	Symbol	Market Capitalization	Global Weight (%)	Area
Australia	AUS	380,087	1.73	Oceania

Table 2 The Summary Statistics of Markets

The summary statistics of the annualized returns of the MSCI indices from 21 developed countries and 13 developing countries from Jan. 1988 to Dec. 2004 is reported. The global systematic risk, β_G , is computed by utilizing the Sharpe-Lintner CAPM model. The risk-adjusted performance indices are Sharpe ratio and Treynor ratio, respectively. The Jarque-Bera and Augmented Dickey-Fuller are the statistics of tests for normality and unit-root, respectively. * and ** denote the statistical significance of 5% and 1%, respectively.

Panel A: Developed Countries

Table 3 The Coefficients of Correlation Between the Markets

The averages of coefficients of correlation of each country with other countries of different groups are reported. The DC, EM, and All are the mean of coefficients of correlation with developed countries, emerging markets, and all countries, respectively. The averages with nations of different regions are also reported.

Panel A: Developed Countries

Table 4 Efficient Frontier of All Countries

In Panel A, the maxima of Sharpe ratio and Treynor ratio, i.e., MSR and MTR, as well as the annualized standard deviation and the weight of each country of the most efficient portfolio (MEP) composed by the markets of all countries with different constraints are reported. In Panel B, the annualized return and standard deviation, as well as their global market systematic risk, Sharpe ratio, and Treynor ratio of minimum-variance portfolio (MVP) composed by the markets of each area with different constraints are reported.

The statistics of Without Restriction (NR) are the results of the optimum of Lagrangian:

$$\min_{\{w, \phi, \eta\}} \frac{1}{2} w^T V w + \phi(E(R_p - w^T E) + \eta(1 - w^T 1)).$$

The statistics of Short-sell Restriction are the results of the optimum of above Lagrangian pluses the follow constraint:

$$0 \leq w_i \leq 1, \text{ for all } i.$$

The statistics of Short-sell and Over-weighted Restrictions are the results of the optimum of Lagrangian including Short-sell Restriction pluses the follow constraint:

$$0 \leq w_i \leq 3w_i(Cap),$$

where $w_i(Cap)$ is the weights of world market capitalization of market i .

Table 5 Efficient Frontier of European Countries

In Panel A, the maxima of Sharpe ratio and Treynor ratio, i.e., MSR and MTR, as well as the annualized standard deviation and the weight of each country of the most efficient portfolio (MEP) composed by the markets of European countries with different constraints are reported. In Panel B, the annualized return and standard deviation, as well as their global market systematic risk, Sharpe ratio, and Treynor ratio of minimum-variance portfolio (MVP) composed by the markets of each area with different constraints are reported. The statistics of Without Restriction (NR) are the results of the optimum of Lagrangian:

$$\min_{\{w, \phi, \eta\}} \frac{1}{2} w^T V w + \phi(E(R_p - w^T E) + \eta(1 - w^T 1)).$$

The statistics of Short-sell Restriction (SR) are the results of the optimum of above Lagrangian pluses the follow constraint:

$$0 \leq w_i \leq 1, \text{ for all } i.$$

The statistics of Short-sell and Over-weighted Restrictions are the results of the optimum of Lagrangian including Short-sell Restriction pluses the follow constraint:

$$0 \leq w_i \leq 3w_i(Cap),$$

where $w_i(Cap)$ is the weights of world market capitalization of market i .

Table 13 Efficient Frontier of European and Oceania Countries

In Panel A, the maxima of Sharpe ratio and Treynor ratio, i.e., MSR and MTR, as well as the annualized standard deviation and the weight of each country of the most efficient portfolio (MEP) composed by the markets of European and Oceania countries with different constraints are reported. In Panel B, the annualized return and standard deviation, as well as their global market systematic risk, Sharpe ratio, and Treynor ratio of minimum-variance portfolio (MVP) composed by the markets of each area with different constraints are reported. The statistics of Without Restriction (NR) are the results of the optimum of Lagrangian:

$$\min_{\{w, \phi, \eta\}} \frac{1}{2} w^T V w + \phi(E(R_p - w^T E) + \eta(1 - w^T 1)).$$

The statistics of Short-sell Restriction (SR) are the results of the optimum of above Lagrangian pluses the follow constraint:

$$0 \leq w_i \leq 1, \text{ for all } i.$$

The statistics of Short-sell and Over-weighted Restrictions are the results of the optimum of Lagrangian including Short-sell Restriction pluses the follow constraint:

$$0 \leq w_i \leq 3w_i(Cap),$$

where $w_i(Cap)$ is the weights of world market capitalization of market i .
